HYDROCARBON LEAK DETECTION & COMPLIANCE MANAGEMENT

LT Environmental, Inc. (LTE) has extensive experience in the oil and gas industry and our proven track record of delivering results cost-effectively makes LTE uniquely qualified to provide this service using our optical gas imaging (OGI) camera.

State and federal agencies have legislated the reduction of volatile organic compound (VOC) emissions through leak detection and repair (LDAR) requirements. LTE uses our OGI camera for field investigations and our in-house database systems to provide file and compliance management to meet these new regulations.

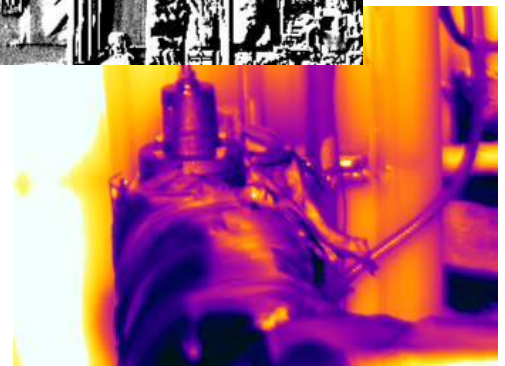

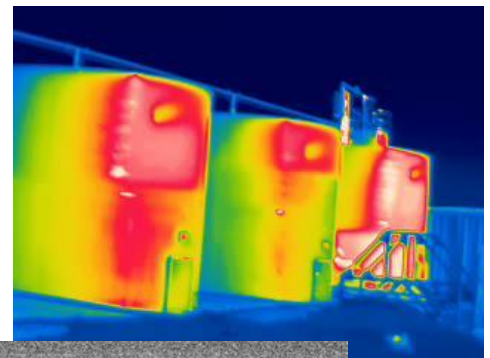

LTE leak detection inspection services include:

- Experienced field inspectors certified in the use of FLIR GF320 OGI camera by the manufacturer
- Comprehensive site evaluations, leak inspections and reporting with optional regulatory compliance audit
- Post-repair leak inspection
- Access to LTE's proprietary secure and confidential client-specific database of leak inspection imaging and documentation to meet regulatory documentation type and time requirements

Our custom database systems offer:

- Inspection summary reports and annual reports
- Inspection-based repair work orders
- Electronic mail notification of inspection results
- Leak repair confirmation reports

LTE can retain site inspection videos and corresponding documentation for the minimum 5-year regulatory requirement using our secure client-specific web-access database systems 24 hours/7 days a week. Cost metrics are dependent upon the complexity and scope of the project.
